GAME COMPONENTS

- 1 game board with stock market
- Cards
 - 7 mountain railway certificates
 - 10 coal company certificates
 - 13 minor company certificates
 - 93 major corporation share certificates
- 55 trains
- 1 priority deal card
- 10 coal company charters
- 11 minor company charters
- 10 corporation charters
- 294 tiles
- 82 tokens
 - 2 for each of the 11 minor companies: 1 station and 1 revenue marker
 - 6 for each of the seven major corporations: 1 par marker, 1 stock price marker, 3 stations, 1 revenue marker
 - 5 for kk and Ug: 1 stock price marker, 3 station markers, 1 revenue marker
 - 7 for Sd: 1 stock price marker, 5 station markers, 1 revenue marker
 - 1 round marker
- A black eagle priority deal marker is provided to use instead of the card if desired
- A bank of 14,268K must be supplied by the players

1. INTRODUCTION

1837 is a development of 1835, designed by Michael Meier-Bachl. The basic concepts are those of 1835, but there are extra features that add complexity.

1835 introduced a third type of railway to the 18xx games genre, the "minor company." Minor companies were small, regional companies owned by a single player which had no share price, but could lay track and own trains, paying 50 percent of their revenue to the player and keeping 50% in its treasury. In 1837, this concept was further extended to introduce a new type of minor company: the coal company.

References in these rules to “**companies**” apply to both minor companies and coal companies. References to “**corporations**” apply to both major corporations and national railways.

These rules do not assume familiarity with 1835.

All monetary values in this game are in Kronen (Crowns). This is abbreviated with a “K” on the game components and in these rules.

2. SETUP

The seating order is determined randomly (use various numbered cards or tokens as needed) and the starting player is given the **priority deal** card. One player is nominated as the banker and takes charge of the **bank** and the other game material.

Distribute the starting capital to each player:

- 730K for 3 players
- 555K for 4 players
- 450K for 5 players
- 380K for 6 players
- 330K for 7 players

The stock certificates marked “Exchange Share” are set aside and will be used later in the game. The other stock certificates are stacked on their respective spaces on the game board, with the Director’s Certificates on top. These stacks form the initial offering.

There are two kinds of train cards: goods trains and passenger trains. Goods trains are denoted with the letter “G” after the number in the top-left corner. Separate the two types and create a stack of each. The passenger trains are stacked in the following order: “2” trains on top, then “3” trains, “3+1”, etc. (increasing order of price), while the goods trains are ordered similarly: “1G”, “2G”, “3G”, and “4G”.

The charters for corporations and companies are placed nearby. These charters have spaces for corporate assets: cash, trains, and tokens. Cash on each charter must always be kept strictly separate from each player's personal cash.

3. OVERVIEW

The game begins with a **start packet auction** and then proceeds in a series of alternating **stock rounds** and sets of **operating rounds**. At the start of the game, there will be one operating round per set and this will increase to three operating rounds per set over the course of the game.

The game begins with the auction of the **start packet** as described in section 8. Once the start packet and the Ug minor shares have been bought, players may also buy and sell shares in the major corporations or national railways during stock rounds. Stock round actions are described in section 9.

During operating rounds, **directors** operate the various corporate entities in order.

1. First, mountain railways pay revenue to their owning players.
2. The coal companies operate in order
3. The minor companies operate in order
4. The major corporations and national railways operate in stock price order.

Operating rounds are described in section 10.

The game starts in Phase 2, and proceeds through a series of phases, each of which commences with the purchase of the first passenger train of a specified type. See section 6 for details on phase changes.

4. GAME BOARD

The game board features a partial map of the Austrian Empire circa 1837, including modern-day Austria, Hungary, the Czech Republic, Ukraine, Italy, Poland, and Bosnia-Herzegovina. Superimposed on the map is a hex grid for track laying. Large circles or solid black dots represent large and small cities respectively. Coal mines are represented with this symbol:

The southwestern-most area of the map is Italy, demarcated by a red border line (section 10.3.4). The shaded hexes in the south represent Bosnia-Herzegovina (section 10.3.3).

The **par value chart** (used to mark the par values of major corporations), a round marker indicator, and the **stock market** are shown below the map.

5. STOCK MARKET

The stock market records the current value of major corporations and national railways, by the position of the company's price marker on the market. The stock price is the value of each share in the corporation.

The pink spaces on the market represent possible starting values for the major corporations, and correspond to the possible par values.

The starting values for the national railways are indicated by their respective logos.

If a price marker is in the yellow area of the market, shares of that corporation do not count against the certificate limit, as described in section 9.2.2.

6. GAME PHASES

The game begins in Phase 2, and as new types of passenger trains are sold, various rule changes come into effect. In some instances the purchase of a new train has an impact on the game but does not trigger a phase change. Sales of goods trains do *not* cause phase changes, but this section notes when such sales causes prior goods trains to rust.

The game begins in Phase 2:

- Only yellow tiles may be laid.
- Mountain pass hexes may only be played on by a company or corporation whose director owns the corresponding mountain railway (section 7.1).
- The coal and minor companies may each own up to two trains.
- Major corporations may own up to four trains.
- Trains cannot be purchased from other companies or corporations.
- Tiles may not be played in Bosnia-Herzegovina.

Phase 3 begins with the sale of the first “3” train:

- Green tiles are available.
- 2G-trains become available, even if all the 1G-trains have not been sold. Unsold 1G-trains remain available for purchase.
- Companies and corporations may now lay tiles in mountain pass hexes even if their director does not own the respective mountain railway (section 7.1) — although in this case there is a charge of 110K.
- Trains may now be purchased from other companies or corporations.
- After the end of the next stock round there will be two operating rounds before the next stock round.
- Tiles may now be laid in Bosnia-Herzegovina.
- The train limit for major corporations is reduced to three.

With the sale of the first “3+1” train:

- The train limit for each coal company, Sd minor company, and kk minor company is reduced to one. The Ug minor companies may always own up to two trains each.

Phase 4 begins with the sale of the first “4” train:

- All “2” trains rust.
- The “3G” trains become available and may be purchased. Unsold “1G” and “2G” trains remain available.
- Italy is now off limits. All tiles on Italian soil are removed (section 10.3.4). The green track tile for Bozen (#426) is placed on the city of Bozen (section 10.4.2).
- The Sd minor companies are closed and the Southern Railway is formed (sections 12 and 12.1).
- The owner of the Kaiser Ferdinand Railway (kk #1) may now declare the k.k. National Railway open (sections 12 and 12.2).

- The train limit for the national railways is 4.

With the sale of the first “3G” train:

- The “1G” trains rust.

With the sale of the “4E” train:

- The director of the Pest-Waitzen Railway (Ug #1) may declare the Hungarian National Railway open (sections 12 and 12.3).

With the sale of the first “4+1” train:

- The k.k. National Railway must be formed if this has not already happened.
- Any unconverted minor companies of the k.k. National Railway must convert at this time. (See section 12.2).

Phase 5 begins with the sale of the first “5” train:

- Brown tiles are available.
- After the next stock round there will be three operating rounds between stock rounds.
- All the “3” trains rust.
- The “4G” trains become available and may be purchased. Unsold “1G,” “2G,” and “3G” trains remain available.
- The Hungarian National Railway must be formed if this has not already happened.
- Any unconverted minor companies of the Hungarian National Railway must convert at this time (section 12.3).
- All remaining coal companies are exchanged for shares of their respective major corporations (section 13), and all mountain railways close.
- The national railways may own up to three trains.
- All other corporations may own up to two trains.

With the sale of the first “4G” train:

- The “2G” trains (and “1G” trains, if any remain) rust.

With the sale of the “5+2” train:

- The “3+1” trains rust

7. CORPORATE ENTITIES

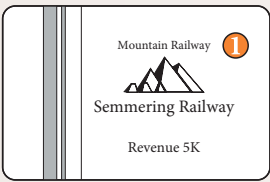

There are five types of companies in this game:

- Mountain railways
- Minor companies
- Coal companies
- Major corporations
- National railways

This section provides a brief introduction to each.

7.1 MOUNTAIN RAILWAYS

Mountain railways are represented by a single certificate. They allow track to be laid in specific hexes, which is further explained in section 10.3.2. At the start of Phase 5 they are all closed and removed from the game.

They do not own trains or lay track. Once purchased, a mountain railway will continue to be held by its original owner until it is removed from the game at the start of Phase 5.

Most, if not all, of the mountain railways will be purchased during the start packet auction (section 8). The following table summarizes the minimum bids for, and income from, each mountain railway.

Mountain railways count as certificates for the purposes of certificate limits (see section 9.2.2). A mountain railway may not be voluntarily discarded by its owner before it closes at the start of Phase 5.

Some mountain railways are purchased together with a Sd minor company. In these cases the associated minor is indicated on the mountain company certificate, and the cost is printed on the minor company certificate.

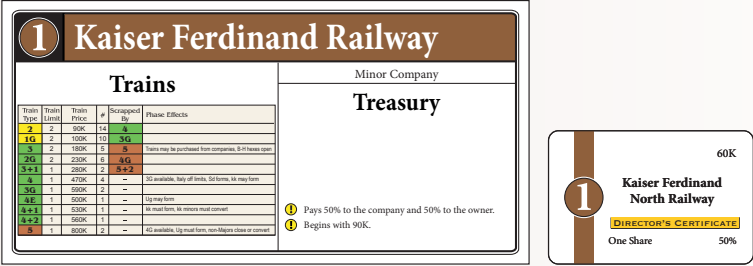

NAME	LOC.	FACE VALUE	INCOME	SD MINOR
Semmering Railway	H16	100K	5K	1
Karst Railway	K13	70K	10K	5
Brenner Railway	J6	90K	15K	4
Arlberg Railway	I5	135K	20K	3
Karawanken Railway	J12	120K	25K	2
Wocheiner Railway	K11	50K	30K	-
Tauern Railway	J10	70K	35K	-

7.2 MINOR COMPANIES

The minor companies are divided into three groups, each of which corresponds with one National Railway:

- Southern Railway (abbreviated Sd for Südbahn)
- k.k. National Railway (Kaiserlich Königlich--Imperial and Royal, abbreviated kk, for k.k. Staatsbahn, called k.k. National Railway in these rules)
- Hungarian National Railway (abbreviated Ug for Ungarische Staatsbahn)

Later in the game each minor will merge into its associated national railway; see section 12 for the procedures.

Each minor company is owned by either one or two players. Their certificates have no cash value and may not be sold.

Minor companies may lay track tiles, operate trains, and buy trains. They may own either goods or passenger trains, or both. Minor companies may not place additional station markers, and they are not required to own a train. See also section 10.7.2.

7.2.1 MINOR COMPANIES OF THE SOUTHERN RAILWAY (SD)

NO.	NAME	HOME STATION	STARTING CAPITAL
1	Vienna-Gloggnitzer Railway	Vienna	90K
2	Kärntner Railway	Marburg	90K
3	North Tyrol Railway	Innsbruck	90K
4	South Tyrol Railway	Bozen	90K
5	Venice-Lombardy Railway	Milan or Venice	90K

The minor companies of the Southern Railway are acquired with the mountain railways. Each receives 90K starting capital.

Later in the game, each certificate will be converted into a share of the Southern Railway. See section 12.1.

7.2.2 MINOR COMPANIES OF THE K.K. NATIONAL RAILWAY (K.K.)

NO.	NAME	STARTING CAPITAL
1	Kaiser Ferdinand North Railway	90K
2	Kaiserin Elisabeth-Railway	140K
3	Kaiser Franz Joseph-Railway	90K

All the minor companies of the k.k National Railway start in Vienna. kk #1 and kk #3 each start with 90K. kk #2 starts with 140K. Later in the game, each share will be converted into a share of the k.k. National Railway. See section 12.2.

7.2.3 MINOR COMPANIES OF THE HUNGARIAN NATIONAL RAILWAY (UG)

NO.	NAME	HOME STATION	STARTING CAPITAL
1	Pest-Waitzen Railway	Budapest	180K
2	Mohacs-Fünfkirchner Railway	Fünfkirchen	90K
3	Pest-Czegled Railway	Budapest	180K

Minor companies Ug #1 and Ug #3 each have two 25% certificates for sale. Each 25% certificate entitles the owner of that certificate to 25% of the revenue generated by the corresponding minor company in each operating round. The company retains the remaining 50%. Minor Ug #2 has only one 50% share.

Minors Ug #1 and Ug #3 are floated with the purchase of their respective director's certificates (25%). Ug #1 and Ug #3 each receive starting capital of 180K. Ug #2 receives only 90K as its starting capital.

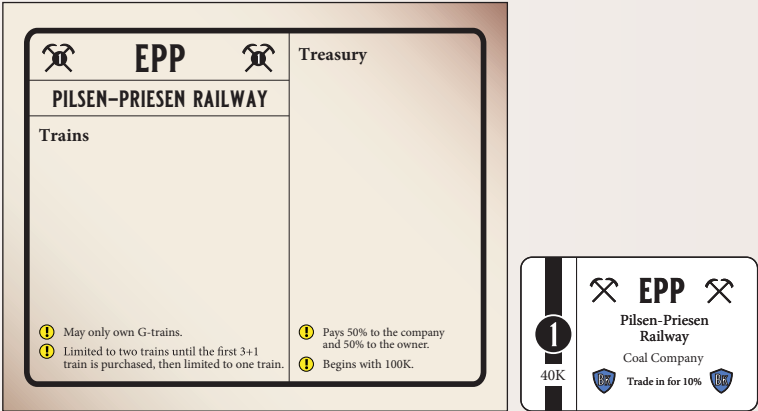

Later in the game, each certificate will be converted into a share of the Hungarian National Railway. See section 12.3.

7.3 COAL COMPANIES

These are similar to the minor companies, but they make their money by carrying coal from mines to towns and cities. They may lay track tiles, operate goods trains (only) and buy goods trains (only).

Coal companies are owned by a single player and may not be sold. They each start with 100K.

Each coal company has a square mine printed on the board that functions as its home station.

Coal companies may only own goods trains (“G” trains). They are not required to own a train. See section 10.7.1 for the operation of coal companies.

Each coal company is associated with the major corporation shown on its certificate. Later in the game, the coal company will be exchanged for a 10% exchange share of this major corporation. See section 13 for this procedure.

NO.	NAME	LOC.	ASSOCIATED MAJOR
1	EPP (Pilsen-Priesen Railway)	E11	BK
2	RGTE (Reichenberg-Gablonz-Tannwalder Railway)	A13	BK
3	EOD (Oderberg-Dombrán Railway)	C19	MS
4	EKT (Karwin-Teschen Railway)	C21	MS
5	MLB (Mosty-Lemberg Railway)	B32	CL
6	ZKB (Zarnesti-Kronstadt Railway)	J34	TR
7	SPB (Simeria-Petroseni Railway)	K31	TR
8	LRB (Lugoj-Resita Railway)	L30	TI
9	BB (Bosna-Bahn)	P20	BH
10	EHS (Hatvan-Salgótarján Railway)	F26	TI

7.4 MAJOR CORPORATIONS

These are the traditional public corporations that are common to 18xx games. They have ten shares of stock divided across nine certificates. The director's certificate counts as two shares and is worth 20% of the corporation, while the remaining eight certificates represent single shares worth 10% of the corporation. These shares can be bought and sold by players during share rounds, as described in section 9.

Each major corporation has a director. The player who buys the 20% director's certificate is the director of that corporation (see section 9.2.1), and remains the director unless another player obtains a larger percentage ownership of the corporation (section 9.4).

Major corporations may lay track tiles, place additional tokens, operate trains, pay out or retain earnings, and buy trains. They may own goods and passenger trains. The director is solely responsible for the operation of the corporation.

7.5 NATIONAL RAILWAYS

National railways are similar to major corporations, with a few differences:

- They are formed via merger of their associated minor companies (described in section 12).
- Their director's certificate is a 10% share and is not purchased, but otherwise the rules in section 7.4 apply.
- They may own a greater number of trains than the major corporations.
- Their starting share values are pre-determined, as printed on the stock market.

The following major corporations and national railways may be formed during the course of the game.

NAME	HOME STATION	SHARES FOR SALE	TOKENS
Southern Railway	Vienna	5	5
k.k. National Railway	Vienna	7	3
Hungarian National Railway	Budapest	5	3
Bohemian Commerce Railway	Prague	8	3
Moravian-Silesian Railway	Brünn	8	3
Galician Transverse Railway	Tarnopol	10	3
Carl Ludwig's Railway	Lemberg	9	3
Tisza Railway	Kaschau	8	3
Transylvanian Railway	Kronstadt	8	3
Bosnia-Herzegovina Railway	Sarajevo	9	3

8. START PACKET ROUND, FIRST OPERATING ROUND, AND FIRST STOCK ROUND

Note: The original edition of this game used a Dutch auction. The original auction procedure is provided in section 16 as an option.

8.1 THE START PACKET

The start packet is laid out near the game board. The following 23 items are included in the start packet (also shown in the diagram):

- 10 coal company certificates
- 3 kk minor company certificates
- 3 Ug minor company director's certificates
- 5 Sd minor company certificates each along with their associated mountain railways
- 2 mountain railways not associated with an Sd minor company (Tauern Railway and Wocheiner Railway)

Each of the following pairs of Sd minor companies and mountain railways are sold as a single item. The minimum bid for the pair is listed only on the minor company certificate. The associated minor company is indicated on each mountain railway.

- Vienna-Gloggnitzer Railway (Sd #1) and Semmering Railway
- Kärntner Railway (Sd #2) and Karawanken Railway
- North Tyrol Railway (Sd #3) and Arlberg Railway
- South Tyrol Railway (Sd #4) and Brenner Railway
- Venice-Lombardy Railway (Sd #5) and Karst Railway

The secondary Ug minor company certificates are not part of the start packet and become available to buy in the first stock round.

8.2 START PACKET ROUND

The items in the start packet are auctioned off in the start packet round. The round proceeds in turns, with the player holding the priority deal card taking the first turn.

On a player's turn, they may either start an auction for any one of the items in the start packet or pass. The minimum starting bid is printed on each certificate.

The auction proceeds in clockwise order with each player either bidding multiples of 5K more than the previous bid or passing (alternatively players may bid in smaller increments, such as 1K, if all players agree before the auction starts). Players that pass are out of contention for the auctioned item. After all but one player has passed, this player pays their bid to the bank and takes the item (and the associated charter, if relevant). The priority deal card is given to the player to the left of the purchaser, and it is now that player's turn.

If a player passes their turn to start an auction, the next player to their left is given the priority deal card.

This auction process continues until all players pass or the start packet is completely sold out. The start packet round ends if either:

- All items in the start packet have been sold
- All players pass the opportunity to start an auction or purchase a secondary share

Now give the priority deal card to the player to the left of the last player to purchase something. Set aside any unsold start packet items and the Ug minor secondary shares. These will be available during stock rounds for purchase at face value.

8.3 FIRST STOCK ROUND AND RESTRICTIONS ON BUYING MAJOR CORPORATION SHARES

The first stock round immediately follows the start packet round. Any remaining start packet items can be purchased on a player's turn at face value. This counts as a purchase.

The two secondary certificates of Ug #1 and Ug #3 are available, along with any remaining items from the start packet, each for their printed face value.

No shares of major corporations or national railways may be purchased until all of the start packet items and the Ug secondary shares have been purchased. This restriction applies in the first and all subsequent stock rounds. After all the start packet items and the Ug secondary certificates have been purchased, the major corporation and national railway shares become available as in a normal stock round.

Like other stock rounds, this stock round ends when all players have passed consecutively. Then proceed to the first operating round.

8.4 FIRST OPERATING ROUND

During the first operating round, the coal companies and minor companies that were purchased operate following the rules described in section 10. The game begins in Phase 2.

Each coal company begins the game with initial capital of 100K from the bank, regardless of the purchase price. Each minor company receives the amount printed on its charter from the bank, regardless of the purchase price. This money is placed in the companies' respective treasuries and each minor company's home token is placed on the map to mark its home station.

Before the Venice-Lombardy Railway (Sd #5) lays its first tile, its director must decide which city (Milan or Venice) to take as its home station and must place the Sd #5 token on this city. If Sd #5 was not sold during the start packet auction, its token is placed in Milan when it operates for the first time.

9. STOCK ROUNDS

Note: At the start of a stock round, minor companies may be folded into national railways (section 12) and coal companies may be exchanged for major corporation shares (section 13). This is done before any of the other actions described in this section may be taken. Once all minor and coal company exchanges have taken place, the stock round begins.

During a stock round, players may sell and buy shares. All transactions take place between the player and the bank. Players may not sell shares to, or buy shares from, each other.

The player with the priority deal card begins each stock round. Players take turns proceeding from the left around the table. On their turn, a player may sell shares and may buy one certificate. These actions may be done in either order (sell-buy or buy-sell). Alternatively, a player may do nothing and pass instead.

The round ends when all players have passed consecutively. The player to the left of the last player to buy or sell something receives the priority deal card and will start the next stock round.

If no shares are sold or bought in a stock round, the priority deal card stays with its current holder.

During a stock round a player will normally have several opportunities to buy and/or sell shares. If a player buys or sells a share, they are guaranteed the opportunity to buy or sell shares again, since the round does not end until all players have passed consecutively.

9.1 STOCK SALES

Only shares of major corporations or national railways may be sold. Minor companies, coal companies, and mountain railways may not be sold.

When a share is sold, it is placed in the bank pool, and may later be bought by other players. The seller receives the current share price prior to the sale from the bank.

A player may sell as many shares during their turn as they wish. The only exceptions are:

- No more than 50% of a corporation's shares may be in the bank pool
- No shares may be sold in a corporation that has not yet operated.
- A director's certificate may not be sold to the bank pool.

Every time shares of a corporation are sold, the share price marker for that corporation is moved diagonally down and to the left one hex. The number of shares sold is not a factor. This price change takes place after the sale of the shares is complete.

If several players sell shares in a corporation, or if one player sells on two or more occasions, then the share price marker is moved to the left and down each time.

If the share price marker reaches one of the edges of the stock market (either the bottom edge or the left-hand edge), it stays where it is.

If, as a result of a change of directorship, a player exceeds the certificate limit, they must sell shares on their next turn until they meet the certificate limit.

9.2 STOCK PURCHASES

Note: No shares may be purchased until all of the start packet items and Ug minor secondary shares have been sold - see section 8.

Note: Coal company exchanges are another way to obtain shares - see section 13.

A player may buy either certificates from the initial offering or, if available, certificates from the bank pool.

New shares are bought from the initial offering at the par price, which is set when the company is formed. The price of shares in the bank pool is the current price, as determined by the position of that company's share price marker on the stock market. Any transaction involving non-initial offering shares takes place at this price.

After a player has sold one or more shares in a given corporation they may not buy any more shares of that corporation during the current stock round. Only in the next stock round may that player again buy shares in the affected corporation.

Shares of the national railways are available for purchase once all the start packet items and Ug minor company shares have been sold, but they do not operate until they have formed (section 12).

9.2.1 MAJOR CORPORATIONS

The first certificate bought in a major corporation must be the director's certificate (see section 9.4 for additional information on director's certificates). The player who buys this certificate sets the par value for that corporation. Seven par values are available to choose from, but only two companies may use each value. When a corporation is started, place a token on a space corresponding to the selected par value on the chart.

Major corporations do not operate until they have "floated," which occurs once 50% of the company's stock has been purchased. See section 9.3.

9.2.2 CERTIFICATE LIMITS

Players may not buy shares that cause them to own more than 60% of a corporation. If a player holds more than 60%, they must sell down to 60% at their first available opportunity. Normally this may only happen as the result of a coal company exchange (section 13).

No player may own a total number of certificates greater than the number shown on the certificate limit table shown on the board. Mountain railways, minor companies, coal companies, and shares in corporations all count toward this limit.

Shares in corporations whose share price marker is on one of the hexes in the yellow bottom left-hand section of the stock market do not count towards the certificate limit.

9.3 FLOTATION OF MAJOR CORPORATIONS

Note: The formation procedures for national railways are described in section 12. For the major corporations the procedure is as follows.

As soon as 50% of a corporation's shares have been bought from the initial offering, it floats and will be active during the next operating round. (Remember that exchange shares are not part of the initial offering.) The director takes the charter and all the tokens for that corporation.

A marker is placed on the stock market on the pink hex that is marked with the initial share price of the corporation. If the hex already has a marker(s) of another corporation on it, the new marker is placed under the old one(s).

A token of the new corporation is placed on the corporation's home station.

The bank pays the operating capital into the corporation's treasury. The initial operating capital is equal to the sum of the initial values of the shares that make up that corporation's initial offering, which does *not* include the exchange shares.

Example: The initial share price of the Transylvanian Railway has been set at 85K. 80% of the Transylvanian Railway is included in its initial offering (two 10% shares are reserved for the exchange of coal companies). The initial operating capital in this example is thus $8 \times 85K = 680K$.

9.4 CHANGES OF DIRECTORSHIP

If another player owns more of a corporation's shares than the director (due to a purchase, sale, or a minor or coal company exchange), and that amount is at least 20% for a major or 10% for a national, they become the new director.

If multiple players own more than the director, the directorship goes to the player owning the largest percentage of the corporation (provided they meet the minimum requirement). If multiple players are tied for majority ownership, the directorship transfers to the first such player to the left of the old director.

The new director exchanges their old certificate(s) for the director's certificate. For major corporations this is two 10% certificates, and for nationals it is one 10% certificate. In other words, the new director's total ownership in the corporation does not change as a result of this exchange.

If this transfer is the result of the director selling shares, the director's certificate is exchanged before resolving the sale.

A director may *only* transfer the directorship via sales if another player meets the minimum ownership requirement, and if after the sale there is not more than 50% of the corporation's shares in the bank pool.

The director's certificate may only enter the bank pool if a player goes bankrupt through the forced sale of shares to finance the purchase of a train, as described in section 11.1.

9.5 END OF STOCK ROUND

If at the end of a stock round, all the available shares of an operational corporation are held by players (that is, when there are no shares in the initial offering or bank pool), the share price of that corporation rises diagonally up to the right if the director currently owns 40% or less, otherwise diagonally up to the left. If the movement described is not possible, then it stays where it is. Major corporation exchange shares that have not yet been exchanged (section 13) are not considered for this rule.

The player to the left of the last player to buy or sell something receives the priority deal card and will start the next stock round.

There then follows at least one operating round.

10. OPERATING ROUNDS

During an operating round, the players do not act directly, but rather through the coal companies, minor companies, major corporations and national railways. The owner controls the actions of the coal and most minor companies, while Ug #1 and Ug #3 are controlled by their respective directors. Corporations are controlled by their directors.

Immediately after a stock round, determine the number of operating rounds to play before the next stock round.

- If the game is in Phase 2, only one operating round is played before the next stock round.
- If the game is in Phase 3 or 4, two operating rounds are played before the next stock round.
- If the game is in Phase 5, three operating rounds are played before the next stock round.

10.1 ORDER OF PLAY DURING OPERATING ROUNDS

The following order is observed during operating rounds.

1. Coal companies may be exchanged for exchange shares. See section 13.
2. kk and Ug National railways may form, or minors may be absorbed into them. See section 12.
3. Mountain railways' owners are paid their respective fixed revenue from the bank.
4. Operational coal companies take their turns in the following order:

1. EPP	2. RGTE	3. EOD	4. EKT	5. MLB
6. ZKB	7. SPB	8. LRB	9. BB	10. EHS

Note that this order is roughly clockwise around the board, starting from the northeast.

5. Operational Sd minor companies operate in the order #1 to #5.
6. Operational k.k minor companies operate in the order #1 to #3.
7. Operational Ug minor companies operate in the order #1 to #3.

8. Corporations that are operational take their turns in order of share price, highest first, and each operating one time per operating round. If two corporations have an equal share value, the corporation whose marker lies farthest to the right operates first. If two or more companies have markers on the same space, the companies operate in descending order, from top to bottom.

Note: National Railways that form during an operating round, due to a train purchase, do not operate until the subsequent operating round.

10.2 ORDER OF COMPANY/CORPORATION ACTIONS

Coal companies, minor companies, and corporations may carry out the following actions during their turn in an operating round. These actions must be carried out in the order given.

1. Lay a yellow tile (section 10.3) or upgrade a tile in Phase 3 or later of the game (section 10.4). This action is optional.
2. Purchase and place a station token (section 10.5). This action is optional. Coal companies and minor companies may not place a station token.
3. Run trains (section 10.6).
4. Calculate the total revenue and either pay out full dividends, half dividends, or withhold the revenue, (depending on entity type, section 10.7).
5. A corporation (only) has its share price adjusted accordingly on the stock market (section 10.7.4).
6. In any order, voluntarily surrender trains and/or purchase trains (section 10.8). Any effects of a new train purchase are carried-out immediately (section 6).

The operating round ends when all the minor and major companies have operated. Either a stock round or another operating round then follows, depending on the phase at the end of the previous stock round (section 10).

10.3 LAYING TRACK TILES

Yellow tiles are laid directly onto the hexes printed on the map and represent railway track. Each company or corporation that is operational may lay tiles in each phase of the game.

At the start of the game (Phase 2), only yellow tiles are available and these may be laid directly onto the map on the light green hexes. The track on the tile must be a continuation of a route (a series of one or more connected track sections that connect to a token of the company or corporation) already available to the company or corporation building it. The new track must connect to a token of that company or corporation (or, for coal companies, its coal mine), and may not be laid if a token of another company or corporation blocks the route.

Hexes printed in brown contain previously laid track and may not be built upon. Yellow hexes with pre-printed track may only have green tiles laid on them starting in Phase 3, when such tiles are available. Green hexes with pre-printed track may only have brown tiles laid on them starting in Phase 5, when such tiles are available.

On its first turn, a company or corporation may either lay a city tile on its starting hex, or extend previously existing track if its home hex already has track on it (printed or previously laid by another company or corporation).

Tiles may be laid on hexes with the following restrictions:

- On hexes with no markings, only track with no stations may be laid.
- On a hex with a small town (black dot), only a tile with a small station (black cross bar) may be laid.
- On a city hex (one with a white circle), only a tile with a large station (also a circle) may be laid.
- On city hexes that contain one of the letters Bu, T, W, X, or Y, only a tile with a large station and the corresponding letter may be laid. See section 10.4.1.
- Hexes with two black dots contain two towns and require tiles that have two small stations (black crossbars) and two separate sections of track (for example, tile #1 or #2). Only one of these separate tracks need be a continuation of a previous route.
- Hexes with two large white circles contain two cities and require tiles with two large stations and two separate sections of track (for example, tile #404). Only one of these separate tracks need be a continuation of a previous route.

No tile may be laid in such a fashion that one or more tracks run into the sea or off the edge of the map. Track may not be laid to run into one of the blank sides of a pre-printed brown hex.

A tile may be laid so that it does not connect with track on adjacent tiles provided that all other rules have been observed.

10.3.1 TERRAIN COSTS

Building on hexes containing mountains or rivers entails costs, which must be paid when the first tile is laid on that hex. The cost of each such hex is printed on the map. These costs must be paid from the treasury of the company or corporation placing the tile and must be paid before the tile is laid.

10.3.2 MOUNTAIN RAILWAYS AND TRACK TILES

Hexes that contain the name of a mountain railway are controlled by the owner of the corresponding mountain railway. If the same player is also the owner of a company or the director of a corporation, then during that company or corporation's turn it may place a tile on that hex, without paying the terrain cost, subject to the normal rules for tile placement. Laying a tile on a mountain railway's hex is considered the normal tile lay of that company or corporation for that turn. In other words, no company or corporation may lay two tiles in one turn by using this special power. This special power may be exercised in any phase, including Phase 2.

Beginning in Phase 3, companies or corporations operated by other players may place a tile on one of these hexes as per the normal rules, but must pay the terrain cost.

10.3.3 BOSNIA-HERZEGOVINA

The pale yellow hexes in Bosnia-Herzegovina may not be built upon until Phase 3, at which point track tiles may be played on them as normal.

10.3.4 ITALY

Italy is in the southwest portion of the map and is delimited by a red border line. Any hex below the red line is considered to be part of Italy. Tiles may be played there normally during Phases 2 and 3. At the start of Phase 4, all tiles in Italy are removed from the board and are returned to the supply. No further tiles may be placed in Italy or pointing to the red border, but any track segments connecting to the border remain in place for the remainder of the game (such tiles may be later upgraded following the normal rules). Additionally, the green Bozen tile is placed (see section 10.4.2 for details on Bozen).

10.4 UPGRADING TILES

Instead of laying a new tile, a company or corporation may upgrade an existing tile: yellow to green, or green to brown. Green tiles become available at the start of Phase 3; brown tiles become available at the start of Phase 5. Once introduced, these tiles remain available throughout the rest of the game. Some tiles may not be upgraded. These are shown on the tile manifest at the end of these rules.

In order to upgrade a tile, either some of the newly-created track must be on a route available to the company or corporation placing the tile, or the value of an upgraded city increases.

Existing track must be preserved during a tile upgrade.

Map hexes that are printed in yellow or green and have track printed on them may also have green or brown tiles laid on them respectively. This counts as a tile upgrade.

Tiles without stations may not be replaced by tiles with stations. In the same way, tiles with towns may not be converted to cities (or vice versa) and single cities may not be converted to double cities (or vice versa) as shown on the tile manifest.

Tiles that have been replaced are once again available for building.

10.4.1 CITIES

Tiles with stations marked Bu, T, W, X, Y may only be upgraded to tiles with the same corresponding letter. Tiles with two separate cities may only be replaced by a tile that also has two separate cities.

When upgrading tiles with more than one city, the connectivity of the cities must be preserved. When upgrading cities, any tokens on the tile must be replaced, in the same city as previously. When the Vienna tile is upgraded to brown, it must be placed such that the three home stations of the k.k. National Railway are merged together.

Upgrading a tile may result in an increase in the number of stations in a city on that tile. If a free space is so created, then any company or corporation may now run trains through that city, and any company or corporation may also build beyond the previously blocked city, subject to the other rules for the placement of tiles.

10.4.2 BOZEN AND BREGENZ

At the start of the game, Bozen is an unlabelled city. It may have a yellow #5 or #57 tile laid on it, and these may be upgraded to green as per the normal rules.

At the start of Phase 4, Italy becomes off-limits and all tiles in Italy are removed. The green Bo tile (#426) is then placed on Bozen, replacing any tile that was there before. The Sd minor #4 token is placed back onto the new tile (although it will immediately be replaced with a Sd National token—see section 12). Because track can no longer run into Italy, there is only one legal orientation for this tile.

When upgrading tile #426 or the preprinted Bregenz hex to brown, a B tile is used.

10.4.3 TOWNS

When a green tile is laid that has both track through a town and also a branch that bypasses the town, the town must remain on the same stretch of track. In other words, the town must remain on the same route as before. For example, upgrading tile #58 to tile #420 is legal, but upgrading tile #58 to tile #410 is not because the town would move from the curved piece of track to the straight one.

10.5 PLACING STATION TOKENS

Each minor company and corporation begins with a token on its home station. A minor's home token is placed when it is purchased. Major corporations place their home token when they float (section 9.3). Nationals inherit their tokens from their minors (section 10.5.2). A coal company's mine functions as its home station. Corporations may also lay additional tokens.

The home token is placed free of charge. For major corporations, a second token costs 20K times the distance in hexes from the home token to the hex which will contain the new token. The distance is the number of hexsides crossed. Placement of a third token costs 40K times the distance from the home station to the hex which will contain the new token. Section 10.5.2 covers token placement for national railways.

This cost must be paid immediately from the major corporation's treasury to the bank. When determining distances for calculating the cost of tokens, the path chosen may not go off the hex grid, although it may cross hexes containing coal mines. Distances are calculated "as the crow flies".

Example: The Southern Railway wishes to place a station token in Krakow (hex C23). It is its first (and only) extra station. Krakow is five hexes from Vienna so the cost is 100K.

The path must use only hexes that the corporation can trace a route to. For the purpose of playing tokens only, the route between a corporation's home station and the new one may involve backtracking (multiple times if necessary). That is, the route may reverse at the edge of any hex and follow any track segment emanating from that edge.

A corporation may place only one token each turn. The home token does not count towards this limit.

A token may be placed on a free station of a city where a white circle exists.

A corporation may not place more than one token on a hex or tile, even though the tile may have several separate cities or one city

with additional free positions. There is an exception for national railways (see section 10.5.2).

A token may only be placed on a free station that is connected to an existing token of that corporation; the connection may be arbitrarily long. The connecting route must not be blocked by tokens of other companies or corporations. Backtracking is allowed in the tracing of such a route for this purpose only.

No corporation may lay a token on a free station which is the home base of another corporation which is not yet in operation unless at least one station in that hex would remain free for that corporation.

Each route run by a minor company's or corporation's trains must include at least one station occupied by one of their tokens (see section 10.6).

10.5.1 MINOR COMPANY TOKENS

The minor companies have only their one home token, which is placed when they are purchased. These tokens will be replaced by tokens of the corresponding national railway when they are merged in.

10.5.2 NATIONAL RAILWAY TOKENS

National railways inherit some of their station tokens from their associated minor companies (these are not paid for), and may also place additional tokens. The first time a national pays for an additional token it does so at the 20K rate, with subsequent tokens at the 40K rate (see section 10.5 for details). The following rules also apply:

- When the Southern Railway is formed (section 12.1), four of its five tokens replace the tokens of Sd minors 1 - 4. The token for Sd 5 is returned to the charter and may be placed later per the normal rules (20K per hex); treat the station token in Vienna as the home token.
- When the k.k. National Railway is formed (section 12.2), its tokens replace its minor companies' tokens as they are merged in. Further, the k.k. must keep its tokens in Vienna until the Vienna tile is upgraded to brown.
- When Vienna is upgraded to a brown tile, two k.k. tokens are removed, leaving one token on the station that has track leading away in three directions. The other two tokens are returned to the charter and may be placed again per the normal rules. The station token remaining in Vienna is the home token.
- When the Hungarian National Railway forms (section 12.3), its tokens replace its minors as they are merged in. Further, the Hungarian National must keep its tokens in Buda and Pest until the Budapest tile is upgraded to brown.
- When Budapest is upgraded to a brown tile, one of the Hungarian National's tokens remains in Budapest, and the other is returned to the charter. It may be placed again per the normal rules; treat the station token in Budapest as the home token.

10.6 RUNNING TRAINS AND ROUTES

Note: The rules in this section apply to both passenger trains and goods trains. Rules specific to each type are provided in the subsequent sections.

A company or corporation may run each of its trains over one route per operating round turn. A route is a continuous unbranched length of track, including on it at least one city with a station token belonging to the company or corporation. A coal mine is considered the home station for that corresponding coal company.

A route must be continuous. It may not run through or to the same town or city more than once, including Vienna, even though it has several distinct stations. However, in Phase 3, both Buda and Pest may be counted separately. The Hungarian National Railway minor companies #1 and #3 can take advantage of this to operate a "2" train between Buda and Pest, earning 100K with that train.

If two separate towns or cities are located on the same tile, it is permissible to include both towns or cities on that tile if track exists linking the two towns or cities together. Examples of this are the Raab and Tatabanya hex just to the west of Budapest and the hex with two small towns immediately to the west of that. This right to visit both towns is lost if, as a result of a tile upgrade, the two separate stations are replaced with one double station.

A route may have as a start or end point a city that has no free stations. A train's route may not run through such a city unless one of the tokens in that city belongs to the company or corporation operating the train.

A route may run freely through a city which is not completely occupied with tokens, i.e. at least one open station exists in that city.

No route may use the same section of track more than once, no matter how small. Separate tracks on the same tile may be used in the same route.

A route that runs into a town or city may leave by any other available route.

If a company or corporation owns more than one train, then each must run an entirely separate route. No piece of track, however small, may be included in more than one of the company or corporation's routes. Routes may cross or meet at towns/cities as long as they use separate tracks to enter and/or leave the station. For example, green tiles with branches may be used by exactly one train, because the two lines of track merge into one at some point on the tile.

A train may not include more towns or cities in its route than its numerical rating as explained in the following sections. Goods Trains have a "G" next to the number; passenger trains do not.

Trains inherited from a company that has already run in the current round may not be run again in the same round.

10.6.1 RUNNING PASSENGER TRAINS

A passenger train route must include on it at least two different towns or cities (a start and an end point), which are connected by track. Passenger trains may not run to coal mines.

The first number on the card is the maximum number of cities and towns that the passenger train may run to or through. If there is a second number, it is the maximum number of additional towns that may also be on the route. For example, a "3" train may run a route from Vienna through Pressburg and end its run at Budapest but may not include a fourth town in its route. A "4+2" train may include four cities and two towns in its route. A town may be substituted for a city in a route for such a train, but not vice

versa. In other words, a “4+2” train could run to just one city and five towns.

Both towns and cities may be used as the starting and/or end point of a route.

The letter “E” after a number denotes an express train. Such a train only includes cities and needs at least two cities on its route. Any towns included in its route are ignored, both for the calculation of the train’s range and for the calculation of its revenue.

10.6.2 RUNNING GOODS TRAINS

Goods trains start their run from a coal mine and trace an unblocked route to or through no more than the train’s number of cities and any number of towns.

The number before the “G” is the number of cities that the goods train may include in its route. The coal mine does not count as a city, and it may not include a second coal mine in its route.

The route must include a station of the operating company or corporation. For coal companies, their associated mine counts as their station. The coal company must run a route to generate any earnings. Thus, a 1G train cannot solely count its mine without any other town or city.

Towns and cities contribute towards the earnings generated by a goods train. The value of the mine is given to the company or corporation treasury directly from the bank, and is not considered part of its earnings.

The first value on each coal mine is used before Phase 5; the second value is used in Phase 5.

10.7 EARNINGS RECKONING AND PAYMENT

The bank pays out the total earnings for each company or corporation differently per type. General rules are covered in this section, but for specific rules, see the following subsections:

- Coal companies are covered in section 10.7.1
- Minor companies are covered in section 10.7.2
- Majors and Nationals are covered in section 10.7.3

The earnings generated by a train are the sum of the values of all the towns/cities included in that train’s route.

The total earnings generated for a company or corporation in an operating round is the total of the earnings generated by each train operated by the company or corporation.

In all cases, money earned from a coal mine is paid directly to the company or corporation, and is not considered part of its earnings.

The share price changes as a result of various payouts are given in Section 10.7.4, Share Price Changes.

10.7.1 COAL COMPANIES

Each coal company may run one goods train every operating round. The route must be from the company’s associated coal mine and include up to its number of cities, plus an unlimited number of towns.

Coal companies always pay their owner 50% of the earnings from towns and cities, and retain the other 50%.

The value of the coal mine from which the train runs is paid to the treasury.

10.7.2 MINOR COMPANIES

Each minor company of the Southern Railway and the k.k. National Railway retains 50% of its earnings in its treasury; the remaining 50% is paid to the respective owners of each minor company.

Each of the minor companies of the Hungarian National Railway retains 50% of its earnings in its treasury and pays the other 50% in the appropriate proportions to its owner(s). Minors Ug #1 and Ug #3 pay 25% to the owner of each of the two certificates, rounded down. Minor Ug #2, which has only one certificate, pays the full 50% to its owner.

If rounding is necessary, calculate the exact dividend the shareholder should receive for all of their shares and then round down the amount paid.

Unsold minor company shares do not pay dividends.

10.7.3 MAJOR CORPORATIONS AND NATIONAL RAILWAYS

For corporations, the director decides how to divide the earnings for each operating round. The director may:

- Pay the entire earnings to the shareholders as dividends.
- Pay only 50% of the earnings to the shareholders as dividends, retaining the remaining 50% in the corporation’s treasury.
- Withhold all of the earnings, which then go to the corporation’s treasury.

No other partial distribution of the revenue is possible.

When a corporation pays a dividend, each shareholder receives a percentage of the total dividend equal to their fractional holding in that corporation. When a major corporation pays half dividends, payouts are calculated exactly and then all fractions are rounded in favor of the bank. For example, if a major corporation earns 50K and elects to pay half dividends, the corporation will receive 25K and a 30% shareholder will receive 7K.

When a corporation pays a dividend and some of its shares are in the bank pool, then the appropriate percentage of the dividend is paid into that corporation’s treasury. Payments for unconverted exchange shares, or shares that are closed or held in the initial offering, are lost.

If a major corporation pays a dividend, money payable to an exchange share from a company that has already operated during this round is paid to the bank. This situation can only occur during the operating round when the 4+1 train is bought, forcing kk #2 and/or kk #3 into kk if not previously exchanged, or when the first 5 train is bought, forcing Ug #2 and/or Ug #3 into Ug, or coal companies into their respective major corporations, if not previously exchanged. Exchange shares acquired at any other time are paid dividends as normal.

10.7.4 SHARE PRICE CHANGES

If a corporation declares a 100% dividend, its share price moves one hex to the right. When this is not possible, it moves upwards and to the right (following the arrow). Once the marker reaches

11. EMERGENCY FUNDRAISING

If a major corporation or national railway is required to buy a train, but it does not have sufficient cash for the purchase, then the director must make up the difference from their own personal cash. If there is a choice of trains available the director is free to decide which to buy, even if it has enough money to buy one of the cheaper choices, but not enough to buy the more expensive choice. The director may not contribute more than the shortfall. This means that the treasury of a corporation so assisted may not contain any cash after such a forced purchase.

If the director's cash is insufficient to make up the difference, then they must immediately sell sufficient shares to raise the cash. The restrictions on sales described in section 9.1 apply. The director may only sell shares in the operating corporation if the sale of such shares does not result in a change of directorship.

11.1 PLAYER BANKRUPTCY

If a director cannot raise the necessary capital through the sale of shares, they are declared bankrupt and are eliminated from the game. Any remaining shares the player owns are placed in the bank pool. The bank then finances the remainder for the train, paying no more than face value. Keep track of the amount financed as it will later need to be repaid. The player who now holds the largest percentage of the corporation takes over control of it. If two or more players tie for the position of the largest percentage, control goes to whichever of the tied players is either the holder of the priority deal card, or the first to the left of the holder of the priority deal card. If no one owns any shares in that corporation, the holder of the priority deal card takes over the running of the corporation. The director's certificate is left in the bank pool, where it is available for purchase in the next stock round.

If the bank has financed the purchase of a train in a forced purchase, that corporation may not pay out dividends until the amount financed has been repaid. The financed train may not be purchased by another corporation until the debt has been repaid. The effect of this enforced withholding on the corporation's share price is the same as if the corporation had voluntarily withheld dividends.

If such a directorless corporation (that is, a corporation in which no player owns shares) is later required to purchase a train again (due to its previous train rusting), then the bank finances the train in the same way as before. In other words, no player is financially responsible for the corporation in such a situation. In practice this is exceedingly rare.

11.2 BUYING A TRAIN FROM ANOTHER CORPORATION DURING EMERGENCY FUNDRAISING

The director of a trainless corporation conducting emergency fundraising may choose to purchase a train from another company or corporation.

The directors of both entities (which may be the same player) first agree on a purchase price for the train. The minimum is 1K.

The price agreed upon may be high enough to require the president of the operating corporation to contribute their own money, or even to sell shares. Such sales of shares must respect the restriction on sales described in section 9.1.

The director may only sell shares in the operating corporation or the corporation selling a train if the sale of such shares does not result in a change of directorship.

The price may not be high enough to cause the purchasing player to go bankrupt. In other words, the purchasing corporation and its director must be able to raise sufficient funds for the purchase. As long as the director is able to raise sufficient funds for the purchase, any price greater than or equal to 1K is allowed.

12. FORMATION OF NATIONAL RAILWAYS

This section describes general rules and procedures for forming the national railways. Sections 12.1 through 12.3 describe additional procedures for each national railway.

The Southern Railway forms immediately upon the start of Phase 4 (see section 12.1). The k.k. National Railway and Hungarian National Railway may optionally form due to the purchase of a train (see sections 12.1 and 12.2), but may also form after these points at the beginning of a stock or operating round.

- If a national railway forms during an operating round (i.e. because the critical train was purchased), it will not run during that round.
- If formed at the start of a subsequent stock round, it will run in the following operating round.
- If formed at the start of a subsequent operating round, it will run that round.

Upon formation, players exchange their minor company certificates for 10% exchange shares of the national railway.

The director of the relevant railway is the player with the most shares in it. In the event of a tie, the tied player who had the relevant minor with the lowest number becomes the director. The director's certificate trumps the non-director's certificate (for example, the tie break order for Ug is: Ug #1-director, Ug #1, Ug #2, Ug #3-director, Ug #3).

The share price marker is placed on the hex marked with its logo.

The national railway takes over the trains and treasuries of the minor companies that folded into it. After the companies have been folded into the corporation, trains in excess of the limit are discarded at the director's discretion.

The tokens of the minor companies are replaced by tokens of the national railway. See section 10.5.2 for more information about national railway tokens.

12.1 SOUTHERN RAILWAY FORMATION

The Southern Railway must form at the start of Phase 4 and all of its certificates are compulsorily exchanged.

The Venice-Lombardy's station marker representing its station for Sd #5 on Milan/Venice is returned to the Southern Railway and is available for placement in a later operating round (see section 10.5.2).

The Southern Railway receives 710K from the bank when it forms. Its starting value on the stock market is 142.

The Southern Railway always forms during an operating round and does not operate until the subsequent operating round.

12.2 K.K. NATIONAL RAILWAY FORMATION

The k.k. National Railway may optionally open at the start of Phase 4, and must be formed after the purchase of the first "4+1" train.

When the first "4" train is purchased, the owner of minor company k.k. #1 decides whether or not the k.k. National Railway will form at this point. This decision is made after the formation of the Southern Railway.

During Phase 4, if the k.k. National Railway has not yet formed, it may do so at the start of a stock round or operating round. The decision about whether to do so is made by the owner of kk #1, after players have the chance to exchange coal companies for shares. Once the k.k. National Railway has formed, the owners of the kk #2 and kk #3 make their decisions about whether to fold into the k.k. National Railway starting with the k.k. director and proceeding clockwise.

When the k.k. National Railway forms, the corporation charter and the director's certificate of kk #1 are exchanged for the charter and director's certificate of the k.k. National Railway. If the directors of kk #2 and/or kk #3 wish to convert, they hand over the assets of their minor companies to the k.k. National Railway and each receive in return one of the 10% "exchange shares." Minor companies of the k.k. National Railway which are not absorbed at this time continue to operate in the usual way and may convert at the start of any stock round or operating round until this conversion is forced with the purchase of the first "4+1" train.

If the owner of the kk #1 chooses not to open the k.k. National Railway at this point, the opportunity to do so presents itself again at the beginning of each operating round and stock round. The owners of the other two minor companies of the k.k. National Railway may exchange their shares at this point per the normal procedure.

When the k.k. National Railway is first formed, if several players tie for having the most shares, the one who owned the lowest-numbered minor becomes the director. If no tying player previously owned a k.k. National Railway minor, the one closest to the left of the former owner of the Kaiser Ferdinand Railway becomes the director. Once a director has been established, it can only shift if the new director owns more shares than the old one.

The k.k. National Railway receives 840K from the bank after forming. Its starting value on the stock market is 120.

12.3 HUNGARIAN NATIONAL RAILWAY FORMATION

The Hungarian National may form when the "4E" train is purchased. At that point it may be formed by the director of Ug #1. When the first "5" train is purchased it must be formed.

If the Hungarian National Railway has not yet formed, but has the option to do so at the start of a stock or operating round (i.e. the "4E" train has been purchased, but the first "5" train has not yet been), the decision about whether to form it is made by the director of Ug #1 after any exchange of k.k. National Railway shares (if applicable). Once the Hungarian National Railway has formed, the directors of the other Hungarian minors make their decisions about whether to fold into the Hungarian National Railway, starting with the Hungarian National Railway director and proceeding clockwise. When the first "5" train is purchased, any minors that have not yet folded in must do so.

If the director of Ug #1 or Ug #3 decides to exchange shares, the other owner of the respective Ug #1 or #3 share must also exchange for a Ug share. These conversions are done simultaneously and the director's certificate of the Hungarian National Railway may only shift after all exchanges are done.

When the Hungarian National Railway is formed, if several players tie for having most shares, the one who was the director of the lowest-numbered minor becomes the Ug director. If no tying player previously directed an Ug minor, the one who owned the lowest-numbered Ug minor becomes the director. If this does not resolve matters, the one closest to the left of the former owner of Ug #1 becomes the director. Once a director has been established it can only shift if the new director owns more shares than the old one.

The Hungarian National Railway receives 875K from the bank when it forms. Its starting value on the stock market is 175.

13. EXCHANGE OF COAL COMPANIES

Coal companies may be exchanged for an Exchange Share in their associated major corporation.

There are three cases where this may happen:

- *(Optional)* If a corporation has floated, the owner of an associated coal company may exchange it at the start of any stock round or operating round.
- *(Mandatory)* If all of a corporation's initial offering shares are held by players or in the bank pool, the associated coal companies are exchanged at the start of the next operating round.
- *(Mandatory)* At the start of Phase 5, all remaining coal companies are exchanged immediately.

If there are several coal companies that could or must be exchanged, they are dealt with in the operating order of their associated major corporations. For each such major corporation, exchanges are made starting with the director and proceeding clockwise. These companies are all folded simultaneously so the

decision about what trains to discard may be determined after all companies have been folded in.

The exchange procedure is as follows:

1. Each coal company's treasury is given to the major corporation.
2. All the trains from coal companies that are folding in are given to the major corporation. If this puts the major corporation over its train limit, the director decides which of the trains the corporation will keep, but may not discard trains that the corporation previously owned, even if trains from the coal companies are preferred. The corporation may only discard enough trains from the coal companies to bring it to the current train limit.
3. Each coal company charter is exchanged for the corresponding exchange share.

If these exchanges take place at the start of an operating round, they do not count towards the 60% maximum holding that a player may own in a corporation. However, the 60% restriction will come into effect in the next stock opportunity to sell shares.

If a train that is inherited by a major corporation has already been used this operating round (because the coal company that owned it already operated), it may not be used again until the next round.

Exchange shares received from the exchange of a coal company, which operated in the same OR in which the exchange took place (due to the start of Phase 5), do not pay dividends during that same OR.

If the corresponding major corporation has not yet floated, the player still receives the designated exchange share. This share counts against the certificate limit. The coal company's assets are placed on the unfloated corporation's charter and remain there until the corporation is floated, at which point they may be used by the corporation.

14. GAME END

If the bank runs out of money during an operating round, the game ends after the current operating round is complete. If the bank runs out of money during a stock round, the game will end after the next operating round. Payouts after the bank runs out of money may be noted on paper and later added to a player's net worth.

All players count up their cash and add in the value of all shares they own (add the face value of open mountain railways and company shares, if any remain in player hands). Corporation assets in the form of treasury or trains do not count. An exchange share in a major corporation of which the director's certificate has not been sold is worth nothing.

If all players bankrupt except one, the game ends immediately and the remaining player wins.

The player with the greatest total net worth wins the game.

15. ACKNOWLEDGEMENTS

Rules version 3.0 revisions by Jason Begy and Scott Petersen. Indexing by Jason Begy.

These rules are rewritten based on earlier translation work by Stuart Dagger and Paul Work. The translation borrowed from an earlier translation of the 1835 rules done by John Webley. These rules were further edited to improve readability.

Paul Work's original effort is documented here.
<http://web.archive.org/web/20090805024712/http://geocities.com/TimesSquare/Arena/5276/depot/1837r.htm>

The revised start packet auction was developed by David Smith, Ian Pendlebury, and "Old Geoff" Hardingham.

Thanks to Steve Thomas and Ian D Wilson for the support.

Thanks to Steve Thomas, Eric Brosius, Paul Work, Andrew Gravelle, and Joshua Wood for rules proofreading.

16. START PACKET AUCTION (FIRST EDITION)

Optionally use the rules presented in this section instead of the start packet auction described in section 8.

The start packet is laid out in three columns as shown in the diagram to the right.

The prices are as shown in the following table:

NAME	COST	REVENUE
Semmering Railway + Sd 1	150K	5K
Karawanken Railway + Sd2	170K	25K
Arlberg Railway + Sd 3	185K	20K
Brenner Railway + Sd 4	140K	15K
Karst Railway + Sd 5	120K	10K
Wocheiner Railway	130K	30K
Tauern Railway	150K	35K
Coal Companies	100K	N/A

The player with the priority card starts.

In each turn, a player may buy one certificate or pass. Once the player has carried out one of these actions, the next player takes their turn.

At the start of the start packet auction, only the certificates in the start packet are available. A player may only buy certificates that are at the top of a column. Initially, this means that a player has a choice of three certificates, the one at the top of each column; later, when one column is completely sold out, the choice will be reduced to two; and later still, when only one column remains, only one certificate will be available.

The purchase price is paid directly to the bank.

A player may not sell shares during the first stock round.

When all the shares in the Starting Packet have been sold, the three Minor Companies of the k.k. National Railway (Kaiser Ferdinand, Kaiserin Elisabeth and Kaiser Franz Joseph) are available for sale for 90K each except k.k. 2 (Kaiserin Elisabeth Railway) which is 140K.

As soon as these have been sold, the five certificates of the three Minor Companies of the Hungarian National Railway become available for 90K each. Only when these five have also been sold may players buy shares in the major corporations. All major corporations are then available simultaneously. Thereafter, if a player wishes to buy a share in one of these companies, they have an unrestricted choice as to which to invest in.

If all players pass in turn and at least one certificate from the start packet remains unsold, the next player with the option to buy may buy one of the available shares (one which is at the top of its column) for 10K less than the current price. If this player now makes a purchase, the certificates on offer revert to full price; if no purchase is made, the option of the reduced price purchase passes to the next player. If there is a second consecutive complete round of passes, the discount is increased by a further 10K. Whenever a player makes a purchase with a discount, the price of the remaining shares reverts back to normal. If all players continue to pass in succession, the discount continues to increase in 10K increments each time the last player to buy passes. If players all pass when the price is 5K, the price becomes 0K.

Example: Four players --- A, B, C and D.

A buys the EKT for 100K.

B buys the EOD for 100K.

C passes.

D buys the BB for 100K.

A, B, C and D all pass.

A can now buy either the Karawankenbahn, the EPP or the Semmeringbahn for 10K cheaper than normal. A buys the EPP for 90K.

B must again pay full price for anything they buy. B buys the Karawankenbahn for 170K.

C, D, A and B all pass.

C can now buy either the MLB, the RGTE or the Semmeringbahn for 10K cheaper than normal. C chooses to pass.

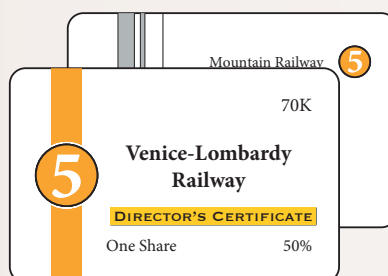

D, A and B also pass.

C can now buy either the MLB, the RGTE or the Semmeringbahn for 20K cheaper than normal. C buys the MLB for 80K.

In theory this process could result in the price of a certificate being reduced to zero. If this happens, the player immediately after the player who last bought must take that certificate.

This process continues until the start packet is completely sold out. After the start packet sells out, discounts are no longer offered. Should all players pass in turn at any point after this, the first stock round ends. The player immediately to the left of the last player to buy receives the priority card for the next stock round.

Apply the standard rules from this point on.
